Envisage Global Insurance

Enrollment API Implementation

Implementing the Envisage Global Insurance Enrollment API will allow you to process enrollments automatically from your database to our insurance database seamlessly. Gone are the days of manually entering insurance information or uploading excel sheets, and best of all there is no human error!

What is an API?
API stands for "Application Programming Interface" and essentially it is a set of clearly defined methods of communication between various software components. In short, it will allow your database to talk to ours and upload your participants details automatically to us for processing.

What is involved in setting up the API?
Our complete API documentation is available for your technical staff that outlines all the components of the API and how it works. There is some initial technical work involved, for which we will provide complete support from our side to answer questions and guide your technical team. Once the API is implemented, you will not need to process enrollments manually or upload them via excel - they will be uploaded automatically through the API.

For more information about the API, please contact us:
